G & S Ranch

Registered Red Polls

Functional — With Class!

Over the years the bulls that we have used and those that we have developed and bred in our program have been out of the most fertile productive dams. These are bulls with slightly lighter birthweights than the highest in the herd and their dams calved them unassisted. The dams of these bulls also calved unassisted with their first calf. The bulls when bred to first calf heifers had a high percent of unassisted births.

We cannot tolerate big slow calves; if the coyotes don't get them, the fireants will. Our cows average over 1200 pounds and can have up to 100 pound calves without problems breeding back.

Most of our bulls will adapt to cows that need to have smaller calves, hence our calves will weigh from 65 to 89 pounds for first calf heifers and 79 to 95 pounds from mature cows. In our herd cows must milk heavily and the calves grow on mostly grass and milk with very little supplement other than mineral. We feed first calf heifers 2 to 3 pounds of cracked milo per day for 30 days while breeding. Calves are fed enough creep feed to condition them to bunk feeding just prior to weaning.

We have been working on carcass traits since the early 1970's. In 1976 we had the All Breeds Reserve Grand Champion Get of Sire carcasses at the Indiana State Fair.

A year ago we had the results shown above in the highly accredited Texas A&M University Texas Ranch to Rail Program.

These attributes run deep in our herd. We also like for them to do as well in the show ring as possible. People will want cattle that have good conformation and are attractive, so they will sell better for them.

Our cattle must meet these functional and performance requirements if they are to be shown. For show, we feed a high fiber ration which takes longer to prepare the cattle for the show ring. Some times they aren't quite fat enough for the judge, but they will go back home and work on grass. That is what we are raising them to do.

There are numerous factors to consider in raising cattle. With G & S Red Polls it is possible to start with cattle that are genetically sound and will perform on a good program of grass, proper herd health and sound management.
